Small Animal Fluid Therapy, Acid-base and Electrolyte Disorders - Elisa M. Mazzaferro

2013-06-04 Fluid therapy is one of the most important, yet controversial, aspects of therapy in veterinary medicine. Opinions differ as to how best to provide fluid therapy in different disease states. Recognizing these differences, the author provides guidelines for the safe implementation of fluid and transfusion therapy in clinical practice. The text first describes the physiologic fluid compartments of the body and how fluid travels from place to place within the body. Clinical chapters then deal with how to place and maintain intravenous and intraosseous catheters, with crystalloids and colloids, with transfusion medicine, with the diagnosis and treatment of electrolyte disorders, and with shock and resuscitation. Clinical cases reinforce the principles and concepts described and the book is fully illustrated throughout. The Color Handbook is designed to appeal alike to veterinary practitioners, to technicians/nurses and to veterinary students.

Small Animal Emergency and Critical Care

Medicine-Elizabeth A. Rozanski 2012-04-30
Emergency and critical care medicine is one of
the fastest growing fields of veterinary practice.
Virtually every life-threatening disease can
present for emergency evaluation, requiring
knowledge of internal medicine, neurology,
cardiology, oncology, anesthesia, and much
more. Rapid and effective application of this
knowledge can mean the difference between life
and death for the animal. Critical care requires
the recognition of subtle changes in the clinical
course of animals, and the ability to take
corrective action before severe systemic disease
becomes irreversible. Clinical decisions
regarding seemingly small items, such as fluid
therapy, antibiotics, or analgesics, can have a
profound impact on patient outcome. This book
focuses on management of the more common
emergency and critical care conditions
encountered in clinical practice, collated in a
concise manual. There are chapters on
emergencies affecting each body system, on
toxicology and other environmental causes, and
on critical care techniques ranging from patient
monitoring, anesthesia and analgesia to fluid therapy, transfusion medicine and nutritional support, plus a chapter describing clinical skills and procedures. The text is illustrated by top-quality color photos, imaging and diagrams, and key information is highlighted in tabular form. The authors combine experience in teaching and in clinical practice, and provide a ready resource for all those actively engaged in the field: practitioners and trainees, technicians, and nurses.

Dengue—World Health Organization 2009 This publication is intended to contribute to prevention and control of the morbidity and mortality associated with dengue and to serve as an authoritative reference source for health workers and researchers. These guidelines are not intended to replace national guidelines but to assist in the development of national or regional guidelines. They are expected to remain valid for five years (until 2014), although developments in research could change their validity.--Publisher's description

Fluid Resuscitation—Institute of Medicine 1999-10-05 Historically, 20% of all injured combatants die on the battlefield before they can be evacuated to a field hospital. Blood loss—hemorrhage—is the single major cause of death among those killed in action whose lives might otherwise be saved. Fluid resuscitation and the treatment of hypovolemia (the abnormally decreased volume of circulating fluid in the body) offer the greatest opportunity for reducing mortality and morbidity associated with battlefield casualties. In Fluid Resuscitation, a committee of experts assess current resuscitation fluids and protocols for the treatment of combat casualties and make recommendations for future research. Chapters focus on the pathophysiology of acute hemorrhagic shock, experience with and complications of fluid resuscitation, novel approaches to the treatment of shock, protocols of care at the site of injury, and future directions for research. The committee explicitly describes the similarities and differences between acute medical care during combat and civilian emergency trauma care. Fluid Resuscitation should help energize and focus research in both civilian and military emergency care and help save the lives of citizens and soldiers alike.
